ABSTRACT AMENDMENTS

Replace the Abstract with:

On the surface of a back board ~~30 are provided~~ outermost-layer signal lines ~~6a, 6b, each having a length different form each other on the basis of the~~ have different lengths. A difference in ~~length between~~ lengths of connector lines ~~3a, 3b, and these~~ connected to the outermost-layer signal lines ~~are connected with the connector lines 3a, 3b, respectively~~ makes the total signal line lengths substantially equal. A digital signal ~~"a"~~ generated in the circuit of a daughter board ~~10~~ reaches a through hole ~~2a~~ through an internal-layer signal line ~~1a~~ traced within the internal layer of the daughter board ~~10~~, and is further transmitted to an internal-layer signal line ~~5a~~ of the back board ~~30~~ through ~~the~~ a connector line ~~3a~~, ~~the~~ an outermost-layer signal line ~~6a~~, and a through hole ~~4a~~. The digital signal ~~"a"~~ is further transmitted to ~~an~~ another internal-layer signal line ~~1a'~~ via ~~a~~ another through hole ~~4a'~~, ~~a~~ another connector line ~~3a'~~, and ~~a~~ another through hole ~~2a'~~.
